

PCI COMPLIANCE SIMPLIFIED

Reliant Security provides an integrated products and services platform for merchants with distributed retail locations to meet data security control objectives, including PCI. Our deep industry domain experience and track record of successful implementations in distributed store environments speaks to our leadership position in the PCI compliance world.

The Reliant Security platform satisfies all 12 sections of the PCI Data Security Standard. Our solutions cover the three steps of the PCI compliance process:

Founded in 2005 with a mission to provide secure, cost-effective PCI solutions to traditional and complex private networking solutions, our active participation on the PCI Data Security Standards Council is paramount to our commitment to focus on PCI.

This singular and razor-sharp focus is what allows us to keep our solutions at the forefront of the PCI Regulations, and as a result, keeps our customers ahead of the continuing changes and demands of PCI compliance.

Proven Success

- *Thousands of installations at merchant locations*
- *Years of experience in retail technology*
- *In-depth background with information security*
- *Active member of the PCI Security Standards Council*

Expertise

The Reliant Team has an in-depth understanding of store operations, networking and system applications such as POS, merchandising, inventory management, CRM, and distribution systems.

Our technical expertise extends to LANs, WANS, voice and data systems, wireless networks, enterprise storage and SANs, enterprise server platforms, legacy environments, and information security.

Reliant addresses PCI Requirements on a holistic basis for our customers. This approach ensures our customers will satisfy all of the PCI Requirements and are ready for a complete audit.

The Products

The Reliant Security Managed PCI System (MPS) provides a compliance framework using a 2-Tier technology architecture:

Redbox Security Appliance

Resides at the point of sale and performs multiple compliance functions, including network segmentation, routing, firewalling, intrusion detection, log file aggregation, system file integrity monitoring and wireless access point detection.

PCI Compliance Portal

Provides retail IT managers and compliance auditors with a view into performance against compliance requirements at the store systems level. The portal allows authorized users to view and manage PCI controls across the enterprise.

Two-Tier Architecture

Securely automates and manages compliance - related tasks and data security events. This infrastructure automatically polls stores for security logs and creates incidents where further investigation is required. Additionally, our two-tier architecture automates tasks that ensure the integrity of controls deployed at the stores, including virtualized device operating status and configuration.

All-In-One

The MPS Redbox contains multiple security functions in a single box, which eliminates the need for complex integration of network security products. The consolidation of services in the MPS Redbox provides significant cost savings and offers a simplified and easier approach to manage a PCI solution.

The Business Problem

The PCI Data Security Standard (DSS) is a set of comprehensive requirements for enhancing payment account data security.

The PCI DSS must be met by all organizations (merchants and service providers) that transmit, process or store payment card data. It is not a law. It is a contractual obligation applied and enforced - by means of fines or other restrictions - directly by the payment providers the selves.

All merchants and their service providers are required to comply with the PCI Data Security Standard in its entirety.

The PCI DSS compliance procedure can take anywhere from a day to many weeks, depending on what is uncovered by the vulnerability assessment scan and the self - assessment questionnaire.
